FICTIONAL TEACHING CASE

Alpha - Follow-up nutrition review (13 Oct 2026)

Project-authored vignette | No real patient information

Case and visit

ALPHA-DEMO-2026. Follow-up outpatient nutrition review: 13 October 2026. This note belongs to the same fictional Alpha case as the initial 10 October review.

New observation

Recorded weight: 62.4 kg on 13 October 2026. The previous review recorded 64.2 kg on 10 October. This is a new observation, not a correction or deletion of the earlier measurement.

Interval history

Appetite remains variable and early satiety continues. The patient reports that smaller meals are still easier to finish. Nausea is less troublesome than at the previous review. The patient reports continuing two oral nutritional supplement cartons daily.

What was not reassessed

Food preferences were not reassessed at this visit. There is no updated food diary. Supplement brand and protein content remain unspecified.

Functional context

The patient continues usual self-care; fatigue varies around treatment days. A relative helps with shopping and meal preparation. No new medication or oncological treatment changes are documented.

Follow-up information

No new laboratory results or formal body-composition assessment are available. The change in weight is recorded without assigning a cause. The next review will consider the measurements and intake symptoms from both visits.
