FICTIONAL TEACHING CASE

Beta - Initial nutrition review (10 Oct 2026)

Project-authored vignette | No real patient information

Case and visit

BETA-DEMO-2026. Fictional 67-year-old adult with non-small-cell lung cancer, receiving first-line systemic treatment. Initial outpatient nutrition review: 10 October 2026.

Measurements

Recorded weight: 81.7 kg on 10 October 2026. Previous weight: 83.0 kg on 1 September 2026. Height: 1.80 m. No later weight is provided in this record.

Food intake and symptoms

The patient reports variable appetite and fatigue, with breakfast generally better tolerated than the evening meal. The preferred snack is banana and oat porridge. Swallowing difficulty is not reported in this visit note.

Reported nutrition routine

The patient reports one oral nutritional supplement carton daily. Brand, volume and protein content are not specified.

Daily context and follow-up

The patient lives with a partner who prepares most meals. Short walks and usual self-care remain possible. A later intake review is planned; no follow-up measurements or treatment changes are included here.

Information not available

Measured energy intake, renal function, albumin, body-composition measurements and a formal allergy history are not available in this visit summary.
